

Energy Plus Project - Unit 1

Business Requirements

Project Summary

The **Energy Plus Performance Project** is based on a fictional electricity provider, Energy Plus, a newly established company supplying electricity to residential customers. The business operates a contact center with over 20 employees; however, there is currently no structured or automated reporting in place. Performance is tracked through manual spreadsheets and ad-hoc reports, leaving the leadership team with little visibility into how sales and customer service operations are performing. The Call Center Operations Manager has requested a comprehensive operations report to track sales and contact center performance, introduce clear KPIs, and provide meaningful insights. This project focuses on designing and building a contact center operations dashboard that resolves these challenges and delivers clear, data-driven visibility into business performance.

Why this projects is required (Problem Statement)?

1. Compliance & Service Level Monitoring

Electricity retailers must meet strict service level requirements to comply with industry legislation.

EnergyPlus has no reliable way to track:

- Call wait times
- Abandonment rates
- Average handling times
- Service level compliance by hour/day/agent

Without accurate reporting, the company risks non-compliance and potential penalties.

2. Sales Visibility

The call center also acts as a key sales channel for new customer connections.

However, there is currently **no standardized KPI reporting** to track:

- Number of sales per month
- Conversion rates
- Sales by agent

Leadership cannot identify top performers or optimize sales processes.

3. Lack of Insights for Decision-Making

Because reporting is manual and inconsistent, EnergyPlus struggles to:

- Understand call volumes
- Forecast staffing needs
- Identify operational bottlenecks
- Improve customer experience

Now that we understand the issues, we met with our stakeholders and defined the business requirements outlined below

1. Business Requirements

1.1 Centralized Reporting Dashboard

EnergyPlus requires a single, automated Power BI dashboard that consolidates all call center performance metrics into one place.

The dashboard must:

- Self service power bi dashboard to measure operational performance
 - Replace manual spreadsheets and ad-hoc reporting
 - Support leadership decision-making and compliance monitoring
-

1.2 Team & Agent-Level Performance Monitoring

The dashboard must allow managers to:

- Filter results by **team and date**
- View how their **team is performing overall**
- Compare performance across teams
- Identify underperforming or high-performing agents
- Track progress against targets (e.g. AHT, service levels)
- Accurately reflect agents who **move between teams**, ensuring performance is reported against the correct team for the selected time period

Team movement below:

Alice carter moves from team 1 to team 3 01/04/2025

Olivia Fraser moves from team 3 to team 1 01/05/2025

This supports effective coaching, workload balancing, and ongoing performance management.

1.3 Service Level Compliance Tracking

The company must track service levels to comply with industry regulations.

The dashboard needs to report:

- **Service Level Compliance %** (e.g., % of calls answered within 20 seconds)
 - **Abandonment Rate**
 - **Call Volumes**
 - **AHT (Average Handling Time)** and whether each team/agent meets the AHT target
-

1.5 Sales & Conversion Metrics

As the call center handles new customer connections, the dashboard must measure:

- Number of new sales
- Sales by agent
- Sales Conversion rate (sales ÷ total answered calls)
- Top-performing teams and agents

This supports incentive programs and sales strategy planning.

1.6 KPI's

The following key performance indicators (KPIs), set by the Operations Call Manager, define the performance expectations for the contact center.

- Service level performance must be maintained above 75%.
- Call abandonment rates must remain below 5%.
- A minimum of 95% of incoming calls must be answered.
- Average Handle Time (AHT) must be kept under 480 seconds.

- The contact center is required to achieve a sales target of 1,800 sales per month.
- Each agent is expected to achieve a minimum of 100 sales per month.
- A connection-to-sale conversion rate of 10% must be achieved.
